# A Mathematica module for two-dimensional computer graphics —Data structure and Interpolation algorithms—

Tomomi Hirano Graduate School of Mathematics, Kyushu University \*

December 15, 2016

# 1 Introduction

2D shape interpolation is widely used in Computer Graphics. In 2000, Alexa and Xu suggested new algorithm preserving rigidity for algorithm of this interpolation [?] . These algorithm consists of local interpolations and a global interpolation. The local interpolation means an interpolation between one source mesh and target mesh. Kaji gave the new parameterization method, a computation algorithm, and applications to shape deformation using Lie group and Lie algebra in [?]. In [?], they presented the algorithms to achieve global interpolation, each of which minimizes an error function with userspecified constraints. We introduce a Mathematica module for drawing, transformation, interpolation of two-dimensional polygon figure using results [?] and [?]. We can analyse and investigate critical examples of interpolations using our module. Symbolic computations in Mathmatica enable us a simple method to evaluate those examples using several mathematical formulas. In [?], they showed a closed form for the similarity invariant error function. Further, since it is a quadratic polynomial, we can computate a time-independent matrix used for getting the minimizer. In our module, it contains a function to produce a time-independent matrix by given coordinates of an source figure and a target figure. Giving those coordinates as variable symbols, our function returns a matrix which elements are polynomials of variable symbols. Those polynomials are used for hard cording in another language such as C which does not have a facility of symbolic computations. This means, we can execute faster after compiling the extracted cord.Our module will be publish in Github <sup>1</sup>.

# 2 Preliminary

We consider a  $2 \times 2$ -matrix  $A = \begin{pmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{pmatrix}$ , and an affine matrix  $\begin{pmatrix} B & \alpha \\ \beta & \beta \end{pmatrix}$  which transform three points  $(a_x, a_y)$ ,  $(b_x, b_y)$  and  $(c_x, c_y)$  to  $(v_{1x}, v_{1y})$ ,  $(v_{2x}, v_{2y})$  and  $(v_{3x}, v_{3y})$ , respectively. That is

$$\begin{pmatrix} B & \alpha \\ 0 & \beta \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} v_{1x} & v_{2x} & v_{3x} \\ v_{1y} & v_{2y} & v_{3y} \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} a_x & b_x & c_x \\ a_y & b_y & c_y \\ 1 & 1 & 1 \end{pmatrix}^{-1}.$$

Let  $R_{\delta} = \begin{pmatrix} \cos \delta & -\sin \delta \\ \sin \delta & \cos \delta \end{pmatrix}$  be a rotation matrix. The Frobenius norm  $||M||_F$  of a matrix  $M = (m_{i,j})$  is defined by  $||M||_F^2 = Tr(M \cdot M^T) = \sum_{i,j} m_{i,j}^2$ .

For a given A and B, we want to find a values of  $(v_{1x}, v_{1y})$ ,  $(v_{2x}, v_{2y})$  and  $(v_{3x}, v_{3y})$ , which minimize  $||B - A||_F^2$ . Since  $||B - A||_F^2$  is a quadratic polynomials of  $v_{ix}$  and  $v_{iy}$ , we can find them using the least square method. To solve the problem, we prepare a pre-computed quadratic form matrix defined by simple components of polynomials.

#### Proposition 1.

$$||B-A||_F^2 = \frac{1}{q} \begin{pmatrix} v_{1x} & v_{2x} & v_{3x} & v_{1y} & v_{2y} & v_{3y} \end{pmatrix} \begin{pmatrix} p_{11} & p_{12} & p_{13} & 0 & 0 & 0 \\ p_{12} & p_{22} & p_{23} & 0 & 0 & 0 \\ p_{13} & p_{23} & p_{33} & 0 & 0 & 0 \\ 0 & 0 & 0 & p_{11} & p_{12} & p_{13} \\ 0 & 0 & 0 & p_{11} & p_{12} & p_{13} \\ 0 & 0 & 0 & p_{12} & p_{22} & p_{23} \\ 0 & 0 & 0 & p_{13} & p_{23} & p_{33} \end{pmatrix} \begin{pmatrix} v_{1x} \\ v_{2x} \\ v_{3y} \\ v_{2y} \\ v_{3y} \end{pmatrix}$$

$$+ \begin{pmatrix} k_1 & k_2 & k_3 & k_4 & k_5 & k_6 \end{pmatrix} \begin{pmatrix} v_{1x} \\ v_{2x} \\ v_{3x} \\ v_{1y} \\ v_{2y} \\ v_{3y} \end{pmatrix}$$

where

$$\begin{array}{rcl} q&=&(a_yb_x-a_xb_y-a_yc_x+b_yc_x+a_xc_y-b_xc_y)^2,\\ p_{11}&=&b_x^2+b_y^2-2b_xc_x+c_x^2-2b_yc_y+c_y^2,\\ p_{12}&=&-(a_xb_x+a_yb_y-a_xc_x-b_xc_x+c_x^2-a_yc_y-b_yc_y+c_y^2),\\ p_{13}&=&-b_x^2+a_x(b_x-c_x)+b_xc_x+(a_y-b_y)(b_y-c_y),\\ p_{22}&=&a_x^2+a_y^2-2a_xc_x+c_x^2-2a_yc_y+c_y^2,\\ p_{23}&=&-(a_x^2+a_y^2+b_xc_x-a_x(b_x+c_x)+b_yc_y-a_y(b_y+c_y)),\ and\\ p_{33}&=&a_x^2+a_y^2-2a_xb_x+b_x^2-2a_yb_y+b_y^2. \end{array}$$

We have implemented a function F1a which compute the quadratic form matrix, i.e.

$$F1a(\left(\left(\begin{array}{c} a_x \\ a_y \end{array}\right), \left(\begin{array}{c} b_x \\ b_y \end{array}\right), \left(\begin{array}{c} c_x \\ c_y \end{array}\right)\right), \left(\begin{array}{c} m_{11} & m_{12} \\ m_{21} & m_{22} \end{array}\right)) = \frac{1}{q} \left(\begin{array}{ccc} p_{11} & p_{12} & p_{13} \\ p_{12} & p_{22} & p_{23} \\ p_{13} & p_{23} & p_{33} \end{array}\right).$$

We can verify the fact in Proposition 1 by using a symboic computation using Mathematica.

$$A = \begin{pmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{pmatrix}; B = \begin{pmatrix} \begin{pmatrix} v_{1x} & v_{2x} & v_{3x} \\ v_{1y} & v_{2y} & v_{3y} \\ 1 & 1 & 1 \end{pmatrix}, \begin{pmatrix} a_x & b_x & c_x \\ a_y & b_y & c_y \\ 1 & 1 & 1 \end{pmatrix}^{-1} \right) [[1;;2,1;;2]];$$

$$F1a(\begin{pmatrix} \begin{pmatrix} a_x \\ a_y \end{pmatrix}, \begin{pmatrix} b_x \\ b_y \end{pmatrix}, \begin{pmatrix} c_x \\ c_y \end{pmatrix}), A) ==$$

QuadraticFormMatrix (NormF(B-A),  $\{v_{1x}, v_{2x}, v_{3x}, v_{1y}, v_{2y}, v_{3y}\}$ ) [[1;;3, 1;;3]]//FullSimplify True

A similarity distance between two  $2 \times 2$  matrices  $\min_{s,\delta \in \mathbb{R}} ||sR_{\delta}A - B||_F^2$  can be represented by a closed formula using trace and determinant functions.

### Proposition 2. [?]

$$\min_{s,\delta \in \mathbb{R}} ||sR_{\delta}A - B||_F^2 \quad = \quad ||B||_F^2 - \frac{||B \cdot A^T||_F^2 + 2 \mathrm{det}(B \cdot A^T)}{||A||_F^2}$$

Since the similarity distance  $\min_{s,\delta\in\mathbb{R}}||sR_{\delta}A - B||_F^2$  is also represented by a quadratic polynomials of  $v_{ix}$  and  $v_{iy}$ , We also prepare a pre-computed quadratic form matrix defined by simple components of polynomials.

#### Proposition 3.

$$\begin{array}{lll} f_m & = & m_{11}^2 + m_{12}^2 + m_{21}^2 + m_{22}^2, \\ f_1 & = & m_{11}^2 + m_{21}^2, \\ f_2 & = & m_{12}^2 + m_{22}^2, \\ t_1 & = & m_{11}m_{12} + m_{21}m_{22}, \\ t_2 & = & m_{12}m_{21} - m_{11}m_{22}, \\ X & = & a_y(b_x - c_x) + b_yc_x - b_xc_y + a_x(-b_y + c_y) \\ Y_1 & = & -b_x^2f_1 + a_x(b_yt_1 - c_yt_1 + (b_x - c_x)f_1) \\ & & + b_x((a_y - 2b_y + c_y)t_1 + c_xf_1) + (a_y - b_y)(-c_xt_1 + (b_y - c_y)f_2), \\ Y_2 & = & (-a_yb_xt_1 - a_yc_xt_1 + b_yc_xt_1 + b_xc_yt_1 + a_x^2f_1 + b_xc_xf_1 \\ & & -a_x((-2a_y + b_y + c_y)t_1 + (b_x + c_x)f_1) + (a_y - b_y)(a_y - c_y)f_2), \\ Y_3 & = & ((a_x - b_x)(2a_yt_1 - 2b_yt_1 + (a_x - b_x)f_1) + (a_y - b_y)^2f_2), \\ Y_4 & = & (-a_yb_xt_1 - a_xb_yt_1 + a_xc_ycm + b_xc_yt_1 - c_x^2m_{11}^2 - a_xb_xf_1, \\ & & +a_xc_xf_1 + b_xc_xf_1 + a_yc_xm_{11}m_{12} + b_yc_xm_{11}m_{12}, \\ & & -2c_xc_ym_{11}m_{12} - a_yb_ym_{12}^2 + a_yc_ym_{12}^2 + b_yc_ym_{12}^2 - c_y^2m_{12}^2 - c_x^2m_{21}^2, \\ & +c_x(a_y + b_y - 2c_y)m_{21}m_{22} + (a_y - c_y)(-b_y + c_y)m_{22}^2), \\ Y_5 & = & ((b_x - c_x)(2b_yt_1 - 2c_yt_1 + (b_x - c_x)f_1) + (b_y - c_y)^2f_2), \ and \\ Y_6 & = & ((a_x - c_x)(2a_yt_1 - 2c_yt_1 + (a_x - c_x)f_1) + (a_y - c_y)^2f_2). \end{array}$$

We have implemented a function F2a which compute the quadratic form matrix, i.e.

$$F2a(\left(\left(\begin{array}{c}a_{x}\\a_{y}\end{array}\right),\left(\begin{array}{c}b_{x}\\b_{y}\end{array}\right),\left(\begin{array}{c}c_{x}\\c_{y}\end{array}\right)\right),\left(\begin{array}{c}m_{11}&m_{12}\\m_{21}&m_{22}\end{array}\right))=\frac{1}{f_{m}X^{2}}\left(\begin{array}{cccccccc}Y_{5}&0&Y_{4}&-t_{2}&Y_{1}&t_{2}\\0&Y_{5}&t_{2}&Y_{4}&-t_{2}&Y_{1}\\Y_{4}&t_{2}&Y_{6}&0&-Y_{2}&-t_{2}\\-t_{2}&Y_{4}&0&Y_{6}&t_{2}&-Y_{2}\\Y_{1}&-t_{2}&-Y_{2}&t_{2}&Y_{3}&0\\t_{2}&Y_{1}&-t_{2}&-Y_{2}&0&Y_{3}\end{array}\right).$$

We can verify the fact in Proposition 4 by using a symboic computation using Mathematica.

$$\begin{split} A &= \left( \begin{array}{cc} m_{11} & m_{12} \\ m_{21} & m_{22} \end{array} \right); B = \left( \left( \begin{array}{cc} v_{1x} & v_{2x} & v_{3x} \\ v_{1y} & v_{2y} & v_{3y} \\ 1 & 1 & 1 \end{array} \right). \left( \begin{array}{cc} a_x & b_x & c_x \\ a_y & b_y & c_y \\ 1 & 1 & 1 \end{array} \right)^{-1} \right) [[1;;2,1;;2]]; \\ & \text{F2a}(\left( \left( \begin{array}{cc} a_x \\ a_y \end{array} \right), \left( \begin{array}{cc} b_x \\ b_y \end{array} \right), \left( \begin{array}{cc} c_x \\ c_y \end{array} \right) \right), A) == \\ & \text{QuadraticFormMatrix} \left[ \text{NormF}(B) - \frac{2 \left| B.A^T \right| + \text{NormF}\left( B.A^T \right)}{\text{NormF}(A)}, \{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y} \} \right] \\ //\text{FullSimplify} \\ & \textit{True} \end{split}$$

**Proposition 4.**  $S = (s_1, s_2, \dots, s_n), E = (e_1, e_2, \dots, e_n), V = (v_1, v_2, \dots, v_n), 1 \le k \le n \ \mbox{$\ \xi$ } \ \mbox{$$ 

$$\begin{aligned} & \|(1-t)s_k + te_k - v_k\|^2 \\ &= \|(1-t)s_{kx} + te_{kx} - v_{kx}\|^2 + \|(1-t)s_{ky} + te_{ky} - v_{ky}\|^2 \\ &= ((1-t)s_{kx} + te_{kx} - v_{kx})^2 + ((1-t)s_{ky} + te_{ky} - v_{ky})^2 \\ &= \left( v_{kx} \quad v_{ky} \right) \left( \begin{array}{c} m_{11} & m_{12} \\ m_{21} & m_{22} \end{array} \right) \left( \begin{array}{c} v_{kx} \\ v_{ky} \end{array} \right) + \left( \begin{array}{c} p_{kx} & p_{ky} \end{array} \right) \left( \begin{array}{c} v_{kx} \\ v_{ky} \end{array} \right) + C_k \end{aligned}$$

$$m_{ij} = \begin{cases} 1 & (i = j) \\ 0 & (other) \end{cases}$$

$$p_{kx} = -2((1 - t)s_{kx} + te_{kx})$$

$$p_{ky} = -2((1 - t)s_{ky} + te_{ky})$$

$$C_k = ((1 - t)s_{kx} + te_{kx})^2 + ((1 - t)s_{ky} + te_{ky})^2$$

We have implemented a function ConstPair which compute the quadratic form matrix and vector, i.e.

We can verify the fact in Proposition 4 by using a symbolic computation using Mathematica.

 $\text{ConstPair}[3][\left(\begin{pmatrix} s_{1x} \\ s_{1y} \end{pmatrix}, \begin{pmatrix} s_{2x} \\ s_{2y} \end{pmatrix}, \begin{pmatrix} s_{3x} \\ s_{3y} \end{pmatrix}, \begin{pmatrix} s_{4x} \\ s_{4y} \end{pmatrix}), \left(\begin{pmatrix} e_{1x} \\ e_{1y} \end{pmatrix}, \begin{pmatrix} e_{2x} \\ e_{2y} \end{pmatrix}, \begin{pmatrix} e_{3x} \\ e_{3y} \end{pmatrix}, \begin{pmatrix} e_{4x} \\ e_{4y} \end{pmatrix}), \\
 \{\}, t][[2]] = \text{LinearFormVector}[\|(1-t)s_3 + te_3 - v_3\|^2, \{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y}, v_{4x}, v_{4y}\}] \\
 //\text{Simplify}$ 

True

$$m_{ij} = \begin{cases} \frac{1}{n^2} & (i=j) \\ 0 & (other) \end{cases}$$

$$p_{ix} = -\frac{2}{n}((1-t)s_{mx} + te_{mx}), (1 \le i \le n)$$

$$p_{iy} = -\frac{2}{n}((1-t)s_{my} + te_{my}), (1 \le i \le n)$$

$$C_m = ((1-t)s_{mx} + te_{mx})^2 + ((1-t)s_{my} + te_{my})^2$$

We have implemented a function ConstMatrixM and ConstVectorM which compute the quadratic form matrix and vector, i.e.

$$\begin{aligned} \text{ConstMatrixM}[\left(\left(\begin{array}{c} s_{1x} \\ s_{1y} \end{array}\right), \left(\begin{array}{c} s_{2x} \\ s_{2y} \end{array}\right), \left(\begin{array}{c} s_{3x} \\ s_{3y} \end{array}\right), \left(\begin{array}{c} s_{4x} \\ s_{4y} \end{array}\right)), \left(\left(\begin{array}{c} e_{1x} \\ e_{1y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{2y} \end{array}\right), \left(\begin{array}{c} e_{3x} \\ e_{3y} \end{array}\right), \left(\begin{array}{c} e_{4x} \\ e_{4y} \end{array}\right)), \\ \{\}\}, t] \end{aligned}$$

$$= \frac{1}{16} \begin{pmatrix} 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0$$

$$\text{ConstVectorM}[\left( \left( \begin{array}{c} s_{1x} \\ s_{1y} \end{array} \right), \left( \begin{array}{c} s_{2x} \\ s_{2y} \end{array} \right), \left( \begin{array}{c} s_{3x} \\ s_{3y} \end{array} \right), \left( \begin{array}{c} s_{4x} \\ s_{4y} \end{array} \right)), \left( \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{2x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{3x} \\ e_{3y} \end{array} \right), \left( \begin{array}{c} e_{4x} \\ e_{4y} \end{array} \right)), \left( \begin{array}{c} e_{1x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{3x} \\ e_{3y} \end{array} \right), \left( \begin{array}{c} e_{4x} \\ e_{4y} \end{array} \right)), \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{2x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{3x} \\ e_{3y} \end{array} \right), \left( \begin{array}{c} e_{4x} \\ e_{4y} \end{array} \right)), \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{2x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{3x} \\ e_{3y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{2y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{1x} \end{array} \right), \left( \begin{array}{c} e_{1x} \\ e_{1x} \end{array} \right)$$

$$p_{ly} = 2(s_{ky} - s_{ly})$$

$$C_{kl} = (s_{kx} - s_{lx})^{2} + (s_{ky} - s_{ly})^{2}$$

We have implemented a function ConstfixMatrix and ConstfixVector which compute the quadratic form matrix and vector, i.e.

We can verify the fact in Proposition 6 by using a symbolic computation using Mathematica.

$$\begin{aligned} \text{ConstfixMatrix}[1,2][\left(\left(\begin{array}{c} s_{1x} \\ s_{1y} \end{array}\right), \left(\begin{array}{c} s_{2x} \\ s_{2y} \end{array}\right), \left(\begin{array}{c} s_{3x} \\ s_{3y} \end{array}\right), \left(\begin{array}{c} s_{4x} \\ s_{4y} \end{array}\right)), \left(\left(\begin{array}{c} e_{1x} \\ e_{1y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{2y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{3y} \end{array}\right), \left(\begin{array}{c} e_{4x} \\ e_{4y} \end{array}\right)), \{\}, t] \end{aligned}$$

== QuadraticFormMatrix[ $||v_k - v_l - (s_k - s_l)||^2$ ,  $\{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y}, v_{4x}, v_{4y}\}$ ]//Simplify *True* 

$$\begin{aligned} \text{ConstfixVector}[1,2][\left(\left(\begin{array}{c} s_{1x} \\ s_{1y} \end{array}\right), \left(\begin{array}{c} s_{2x} \\ s_{2y} \end{array}\right), \left(\begin{array}{c} s_{3x} \\ s_{3y} \end{array}\right), \left(\begin{array}{c} s_{4x} \\ s_{4y} \end{array}\right)), \left(\left(\begin{array}{c} e_{1x} \\ e_{1y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{2y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{3y} \end{array}\right), \left(\begin{array}{c} e_{4x} \\ e_{4y} \end{array}\right)), \{\}, t] \end{aligned}$$

== LinearFormVector[ $||v_k - v_l - (s_k - s_l)||^2$ ,  $\{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y}, v_{4x}, v_{4y}\}$ ]//Simplify True

**Proposition 7.**  $S = (s_1, s_2, \dots, s_n), E = (e_1, e_2, \dots, e_n), V = (v_1, v_2, \dots, v_n), 1 \le k, l \le n$   $\ge 7$ 

$$\begin{aligned} & \|v_{k} - v_{l} - R_{2\pi t}(s_{k} - s_{l})\|^{2} \\ &= \|v_{k} - v_{l} - \begin{pmatrix} \cos(2\pi t) & -\sin(2\pi t) \\ \sin(2\pi t) & \cos(2\pi t) \end{pmatrix} \begin{pmatrix} s_{kx} - s_{lx} \\ s_{ky} - s_{ly} \end{pmatrix} \|^{2} \\ &= \begin{pmatrix} v_{kx} & v_{lx} \end{pmatrix} \begin{pmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{pmatrix} \begin{pmatrix} v_{kx} \\ v_{lx} \end{pmatrix} + \begin{pmatrix} v_{ky} & v_{ly} \end{pmatrix} \begin{pmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{pmatrix} \begin{pmatrix} v_{ky} \\ v_{ly} \end{pmatrix} + \\ \begin{pmatrix} p_{kx} & p_{ky} & p_{lx} & p_{ly} \end{pmatrix} \begin{pmatrix} v_{kx} \\ v_{ky} \\ v_{lx} \\ v_{ly} \end{pmatrix} + C'_{kl} \end{aligned}$$

$$m_{ij} = \begin{cases} 1 & (i=j) \\ -1 & (other) \end{cases}$$

$$p_{kx} = -2(\cos(2\pi t)(s_{kx} - s_{lx}) - \sin(2\pi t)(s_{ky} - s_{ly}))$$

$$p_{ky} = -2(\sin(2\pi t)(s_{kx} - s_{lx}) - \cos(2\pi t)(s_{ky} - s_{ly}))$$

$$p_{lx} = 2(\cos(2\pi t)(s_{kx} - s_{lx}) - \sin(2\pi t)(s_{ky} - s_{ly}))$$

$$p_{ly} = 2(\sin(2\pi t)(s_{kx} - s_{lx}) - \cos(2\pi t)(s_{ky} - s_{ly}))$$

$$C'_{kl} = (\cos(2\pi t)(s_{kx} - s_{lx}) - \sin(2\pi t)(s_{ky} - s_{ly}))^{2} + (\sin(2\pi t)(s_{kx} - s_{lx}) - \cos(2\pi t)(s_{ky} - s_{ly}))^{2}$$

We have implemented a function ConstfixMatrix (prop.6 と同様) and Constfix2Vector which compute the quadratic form matrix, i.e.

We can verify the fact in Proposition 7 by using a symbolic computation using Mathematica.

$$\begin{aligned} \text{ConstfixMatrix}[1,2][\left( \left( \begin{array}{c} s_{1x} \\ s_{1y} \end{array} \right), \left( \begin{array}{c} s_{2x} \\ s_{2y} \end{array} \right), \left( \begin{array}{c} s_{3x} \\ s_{3y} \end{array} \right), \left( \begin{array}{c} s_{4x} \\ s_{4y} \end{array} \right)), \left( \left( \begin{array}{c} e_{1x} \\ e_{1y} \end{array} \right), \left( \begin{array}{c} e_{2x} \\ e_{2y} \end{array} \right), \\ \left( \begin{array}{c} e_{3x} \\ e_{3y} \end{array} \right), \left( \begin{array}{c} e_{4x} \\ e_{4y} \end{array} \right)), \{\}, t] \end{aligned}$$

== QuadraticFormMatrix[ $||v_k - v_l - R_{2\pi t}(s_k - s_l)||^2$ ,  $\{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y}, v_{4x}, v_{4y}\}$ ]//Simplify *True* 

$$\begin{aligned} \text{Constfix2Vector}[1,2][\left(\left(\begin{array}{c} s_{1x} \\ s_{1y} \end{array}\right), \left(\begin{array}{c} s_{2x} \\ s_{2y} \end{array}\right), \left(\begin{array}{c} s_{3x} \\ s_{3y} \end{array}\right), \left(\begin{array}{c} s_{4x} \\ s_{4y} \end{array}\right)), \left(\left(\begin{array}{c} e_{1x} \\ e_{1y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{2y} \end{array}\right), \left(\begin{array}{c} e_{2x} \\ e_{2y} \end{array}\right), \left(\begin{array}{c} e_{3x} \\ e_{3y} \end{array}\right), \left(\begin{array}{c} e_{4x} \\ e_{4y} \end{array}\right)), \{\}, t] \end{aligned}$$

== LinearFormVector[ $||v_k - v_l - R_{2\pi t}(s_k - s_l)||^2$ ,  $\{v_{1x}, v_{1y}, v_{2x}, v_{2y}, v_{3x}, v_{3y}, v_{4x}, v_{4y}\}$ ]//Simplify

## 3 ARAP

Let  $n, m \in \mathbb{N}, \bar{n} = \{1, 2, \dots, n\}$ . A polygon  $F = (\{P_1, P_2, \dots, P_n\}, \Delta)$  is a pair of a point set  $\{P_1, P_2, \dots, P_n\}$  and a triangle set  $\Delta = \{k_1, k_2, \dots, k_m\}$ , where  $k_j \in \bar{n} \times \bar{n} \times \bar{n}$  and  $P_i \in \mathbb{R}^2$ . We denote  $k_j = (k_j(1), k_j(2), k_j(3))$  and  $P_i = (P_{ix}, P_{iy})$ . Let  $\mathbf{v}^t = (v_{1x}, \dots, v_{nx}, v_{1y}, \dots, v_{ny})$  and  $\mathbf{v}^t_k = (v_{k(1)x}, v_{k(2)x}, v_{k(3)x}, v_{k(1)y}, v_{k(2)y}, v_{k(3)y})$ .

Let  $F_0 = (\{S_1, \dots, S_n\}, \Delta)$ , and  $F_1 = (\{T_1, \dots, T_n\}, \Delta)$  be polygons. For  $k \in \Delta$ , we define  $A_k(t), B_k \in \mathbb{R}^{2 \times 2}$  by

$$\begin{pmatrix}
A_k(t) & \alpha \\
0 & 0 & 1
\end{pmatrix} = \begin{pmatrix}
T_{k(1)x} & T_{k(2)x} & T_{k(3)x} \\
T_{k(1)y} & T_{k(2)y} & T_{k(3)y} \\
1 & 1 & 1
\end{pmatrix} \begin{pmatrix}
S_{k(1)x} & S_{k(2)x} & S_{k(3)x} \\
S_{k(1)y} & S_{k(2)y} & S_{k(3)y} \\
1 & 1 & 1
\end{pmatrix}^{-1} \\
\begin{pmatrix}
B_k(t) & \alpha \\
0 & 0 & 1
\end{pmatrix} = \begin{pmatrix}
v_{k(1)x} & v_{k(2)x} & v_{k(3)x} \\
v_{k(1)y} & v_{k(2)y} & v_{k(3)y} \\
1 & 1 & 1
\end{pmatrix} \begin{pmatrix}
S_{k(1)x} & S_{k(2)x} & S_{k(3)x} \\
S_{k(1)y} & S_{k(2)y} & S_{k(3)y} \\
S_{k(1)y} & S_{k(2)y} & S_{k(3)y} \\
1 & 1 & 1
\end{pmatrix}^{-1}.$$

And we assume  $A_k(t) = A_k^P(t)$  or  $A_k^E(t)$ .  $||B_k - A_k(t)||_F^2$  can be denoted by

$$||B_k - A_k(t)||_F^2 = Tr(B_k - A_k(t))^t (B_k - A_k(t))$$

$$= \mathbf{v}_k^t Q_k(t) \mathbf{v}_k + L_k(t) \mathbf{v}_k$$

$$= \mathbf{v}^t Q'(t) \mathbf{v} + L'(t) \mathbf{v}$$

using a symmetric  $4 \times 4$  matrix  $Q_k(t)$  4 vector  $L_k(t)$ . We also denote it using a symmetric  $2n \times 2n$  matrix  $Q'_k$  and a 2n vector  $L'_k$ .

A constraint function  $C(\mathbf{v})$  is defined by  $C(\mathbf{v}) := \mathbf{v}^t C_M \mathbf{v} + C_V \mathbf{v}$  using  $C_M$  be a  $2n \times 2n$  symmetric matrix, and  $C_V$  a 2n vector.

So we can define an energy function

$$E_F = \sum_{k \in \Delta} ||B_k - A_k(t)||_F^2 + C(\mathbf{v})$$

$$= \sum_{k \in \Delta} (\mathbf{v}_k^t Q_k(t) \mathbf{v}_k + L_k(t) \mathbf{v}_k) + \mathbf{v}^t C_M \mathbf{v} + C_V^t \mathbf{v}$$

$$= \sum_{k \in \Delta} (\mathbf{v}^t Q_k'(t) \mathbf{v} + L_k'(t) \mathbf{v}) + \mathbf{v}^t C_M \mathbf{v} + C_V^t \mathbf{v}$$

$$= \mathbf{v}^t (\sum_{k \in \Delta} Q_k'(t) + C_M) \mathbf{v} + (\sum_{k \in \Delta} L_k'(t + C_V^t) \mathbf{v}$$

$$= \mathbf{v}^t (Q'(t) + C_M) \mathbf{v} + (L'(t) + C_V^t) \mathbf{v}$$

where 
$$Q'(t) = \sum_{k \in \Delta} Q'_k(t)$$
 and  $L'(t) = \sum_{k \in \Delta} L'_k(t)$ .

**Proposition 8.** For any  $s,r \in \mathbb{R}$ , we have Q'(s) = Q'(t) and  $C_M(s) = C_M(t)$ .

We note  $E_F$  is minimum if  $\mathbf{v} = -\frac{1}{2}(Q' + C_M)^{-1}(L' + C_V)$ . Using this  $\mathbf{v}$ , we can construct  $B_k(k \in \Delta)$  which minimize  $E_F$ . 何か嬉しいこと.

$$Q'$$
は t によらないので,  
( $Q'+C_M)^{-1}$ は一回だけ計算すれば良く, 高速計算が可能

In our Mathematica library we can compute Q' using the function QuadraticFormEnergy,  $(C_M \text{ by ConstMatrix}, \text{and } C_V \text{ by ConstVector}).$ 

By Proposition 2,  $\min_{s,r\in\mathbb{R}} ||sR_{\delta}A_k(t) - B_k||_F^2$  can be also denoted by

$$\min_{s,\delta \in \mathbb{R}} ||sR_{\delta}A_k(t) - B_k||_F^2 = ||B||_F^2 - \frac{||B \cdot A^T||_F^2 + 2\det(B \cdot A^T)}{||A||_F^2}$$

$$= \mathbf{v}_k^t U_k(t) \mathbf{v}_k$$

$$= \mathbf{v}^t U_k'(t) \mathbf{v}$$

using a symmetric  $4 \times 4$  matrix  $U_k(t)$  4 vector  $L_k$ . We also denote it using a symmetric  $2n \times 2n$  matrix  $U'_k(t)$ .

And we have

$$E_S = \sum_{k \in \Delta} \min_{s,\delta \in \mathbb{R}} ||sR_{\delta}A_k(t) - B_k||_F^2 + C(\mathbf{v})$$

$$= \sum_{k \in \Delta} \mathbf{v}_k^t U_k(t) \mathbf{v}_k + (\mathbf{v}^t C_M \mathbf{v} + C_V^t \mathbf{v})$$

$$= \mathbf{v}^t (U'(t) + C_M) \mathbf{v} + C_V^t \mathbf{v}$$

where 
$$U'(t) = \sum_{k \in \Delta} U_k(t)$$
.

For  $E_S$ , a Mathematica function for  $U', C_M$ , and  $C_V$  are

**Proposition 9.** There exist  $s,r \in \mathbb{R}$ , such that  $U'(s) \neq U'(r)$ .

SimEnergy は time-independent ではないけど、t も含めて計算することができる関数がある。
